

## BEST SPOT for SEATS ON SITE REPORT

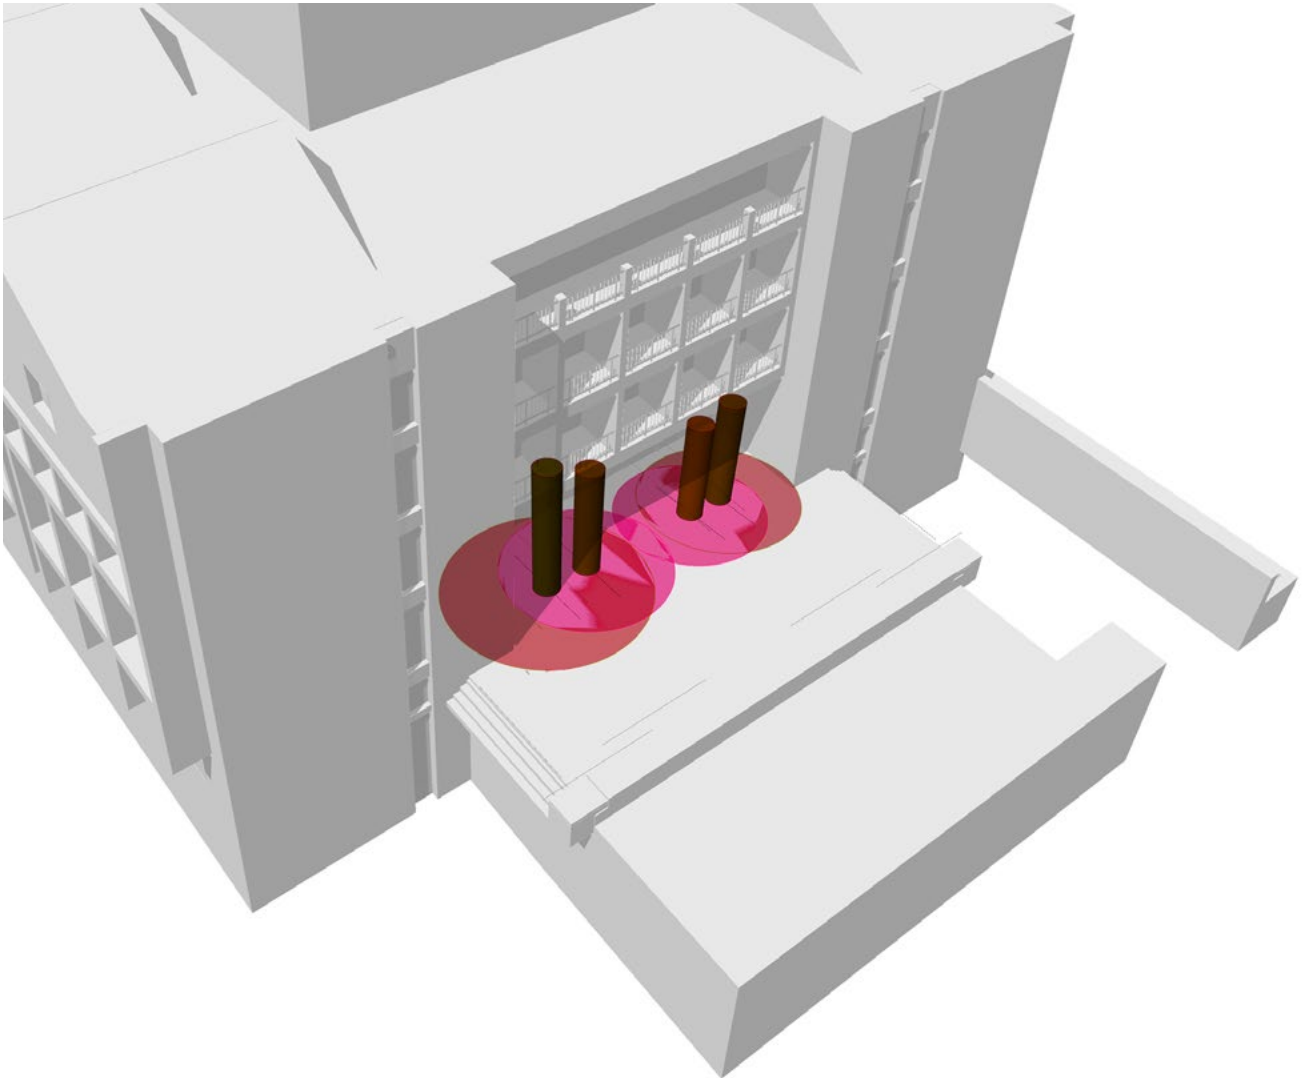

1. To find the best location for outdoor seats means finding the most comfortable place for people. So I need to use the outdoor comfort calculator to find the comfortable hours in site. And then visualize the comfort hours to know where to put the seats.

2. The radius of the circles on the map show the percent of time comfortable on that spot. The bigger the circle is, the more comfortable the spot on site is. The place I choose to do the test is based on the position that could put benches. The place don't have circle on it means that place is not a good for seats for reasons like blocking the entrance.

3. The effective parameters that should be taken under consideration when choosing the seats location is the air temperature, wind speed and humidity during the daytime.

4. The most proper location to place seats is the area under the canopy near the entrance. However, the reflection of radiation from building is not considered during this analysis.
